

First Time User

Integrators can provide Click to Pay checkout for their consumers at multiple stages in a consumer's shopping journey.

The checkout experiences allows Integrators to pass **consumer** and **billing information** to perform checkout.

Integrators can enroll consumers with Click to Pay using `checkoutExperience` parameter of `init()` method and provide the most frictionless checkout experience. In this case, Mastercard DCF displays the consumer profile after performing necessary authentication and finish checkout without any consumer intervention.

The experience below provides options for Integrators to decide at what point in the users' checkout journey they want to enroll the consumer in Click to Pay using the `checkoutExperience` parameter.

NOTE:

- The above use case is an example of an optimized checkout experience. You can tailor these recommendations to best suit your UI.
- The passkey enrollment screen will display the consent-collection layout that is compliant to the specific country's legal regulation.

You must perform the following actions after **setting up the JavaScript library**.

Step 1: Initialize the JS Library and Check if Consumer is Recognized

- On page load, call the `init()` and `getCards()` methods to check if the consumer is recognized to any Click to Pay Systems.
- As this is the consumer's first time with Click to Pay, the consumer or the device will not be recognized. Hence, it will show an empty response from the `getCards()` method where you can collect new card
