

User Recognized through Email/ Mobile Lookup

Merchants can recognize Click to Pay consumers with their email addresses or mobile numbers to offer a seamless checkout experience. For example, merchants can recognize the consumer based on the email ID or mobile number provided by the consumer at checkout or through an email ID or mobile number that already exists with the merchant.

The following steps break down the checkout flow for a user recognized by their email address/mobile number. You must perform the following actions after [setting up the JavaScript library](#).

Step 1: Initialize the JS Library and Check if Consumer is Recognized

1. Call the `init()` and `getCards()` methods on page load to check if the consumer is recognized to any Click to Pay Systems.
2. If the consumer is not recognized, the `getCards()` method doesn't return a list of maskedCard and a 'not recognized' message is sent back to the Integrator.
