

Recognized User

Merchants can offer Click to Pay checkout in a consumer's shopping experience by recognizing the consumer. These are consumers who have selected "Remember me" on their device during a previous checkout. On recognizing the consumer on a trusted device, the merchant should directly display consumer's list of cards associated with Click to Pay. Consumers can simply select a card to pay in a password-free experience.

The following steps shows the checkout experience for a returning user on a trusted device. The merchant can display the Click to Pay User Interface within a widget that renders inside of their checkout, product or shopping cart page. As a merchant, you must perform the following actions after **setting up the JavaScript library**.

Step 1: Initialize the JS Library and Fetch the Card List

1. Call the `init()` and `getCards()` methods on page load to check if the consumer is recognized.

If the `getCards()` method doesn't return a list of maskedCard, you can:

- Call the `authenticate()` method with the consumer-provided email and provide a **User Recognized through Email/ Mobile Lookup** flow.
- Provide a **First Time Users'** experience if consumer's email is not recognized.

2. As the consumer is recognized on a trusted device, the merchant receives consumer's list of cards from Click to Pay. Display the list of cards in the merchant checkout or product page. You can use Mastercard provided **UI Component - SRC Card List** to build the card list screen.

Cardholder

Integrator

Call `init()` and `getCards()` to check if a consumer is recognized on any Click to Pay device.
